Salzburg 2017

Audiveris OMR engine

herve.bitteur@audiveris.org

April 8-9, 2017

Agenda

- Project status
  - ✓ Github organization
  - ✓ Resources
- OMR data
  - ✓ Public model
  - ✓ Symbol interpretation graph (SIG)
  - ✓ Sheet pipeline
- Recognition
  - ✓ Samples repository
  - ✓ Neural networks
  - ✓ Further use of deep learning

Organization on Github

- https://github.com/Audiveris

- audiveris-eg
  - ✓ **E**arlier **G**eneration (former V4 on Kenai)
  - ✓ OMR application with basic UI
  - ✓ GPL
- audiveris
  - ✓ OMR **engine** (former private V5 on BitBucket)
  - ✓ [UI only for engine development]
  - ✓ AGPL

Current resources

- On board
  - ✓ Hervé Bitteur
  - ✓ Maxim Poliakovski
- Collaboration with ZHAW university
  - ✓ **Z**ürcher **H**ochschule für **A**ngewandte **W**issenschaften (= *Zurich University of Applied Sciences*)
  - ✓ « Deep Score » project
    - Philipp Ackermann
    - Lukas Tuggener
    - Thilo Stadelmann
    - Gabriel Eyyi
    - Diego Browarnik

Time for a quick demo

- Show sheet processing
  - ✓ Nota: Set switches for intermediate displays
- Show project file
  - ✓ Zipped archive
  - ✓ book.xml
  - ✓ sheet#n.xml

Project « .omr » file

Sheet processing pipeline

1. LOAD : Load the sheet (gray) picture
2. BINARY : Binarize the sheet picture
3. SCALE : Compute sheet line thickness, interline, beam thickness
4. GRID : Retrieve staff lines, barlines, systems & parts
5. **HEADERS** : Retrieve Clef-Key-Time systems headers
6. STEM_SEEDS : Retrieve stem thickness & seeds for stems
7. BEAMS : Retrieve beams
8. LEDGERS : Retrieve ledgers
9. HEADS : Retrieve note heads & whole notes
10. STEMS : Build stems connected to heads & beams
11. REDUCTION : Reduce structures of heads, stems & beams
12. CUE_BEAMS : Retrieve cue beams
13. TEXTS : Call OCR on textual items
14. MEASURES : Retrieve raw measures from groups of bar lines
15. CHORDS : Gather notes heads into chords
16. CURVES : Retrieve slurs, wedges & endings
17. **SYMBOLS** : Retrieve fixed-shape symbols
18. RHYTHMS : Handle rhythms within measures
19. LINKS : Link symbols
20. PAGE : Connect systems within page

Demo

- Show samples repository
  - ✓ Organized by sheets & shapes
  - ✓ Provide sample glyph
  - ✓ [Within containing image]

Around Neural Networks

- Extraction
  - Glyph → Features
- Classification
  - Features → Shape(s)
- Ranking / Validation / Rejection
  - Based on NN output score
- Segmentation help
  - Pixels gathered into (overlapping) glyphs
  - Glyph1 → top shape 1
  - Glyph2 → top shape 2
  - Which glyph to select ?

Two NN classifiers are used

- Basic
  - ✓ Input: ART + geometric moments of glyph pixels
    - – Vector of 110 values
  - ✓ Shallow architecture (2 layers)
  - ✓ Discriminative

- Deep
  - ✓ Input: scaled glyph pixels
    - – Vector of 1152 values (48 x 24, interline 5)
  - ✓ Deep convolutional architecture (6 layers)
  - ✓ Very good on classification
  - ✓ Questionable on ranking (due to softmax activation?)

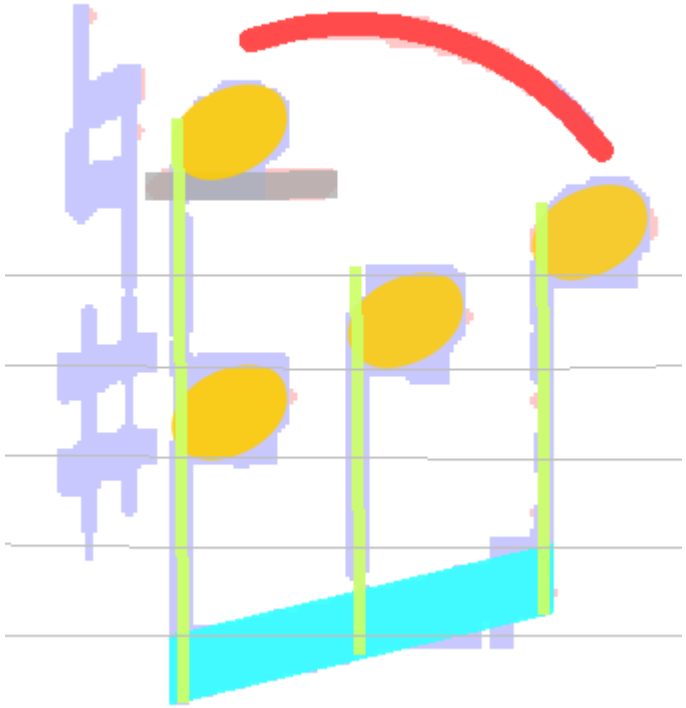
Segmentation problems

- How do we get classifier input?
- Typical sequence is:
  1) Detection & removal of staff lines
  2) Aggregation of connected pixels into glyphs
  3) Glyphs aggregation into larger compound glyphs?
  4) [Features extraction from glyph pixels]
- Symptoms
  - ✓ Collateral damage due to staff removal
  - ✓ No easy control of compound aggregations
  - ✓ No easy way to separate stuck symbols
    - – Heuristic Over-Segmentation?
  - ✓ Complex shape-specific processing

Typical examples

- Staff removal

- Stuck symbols

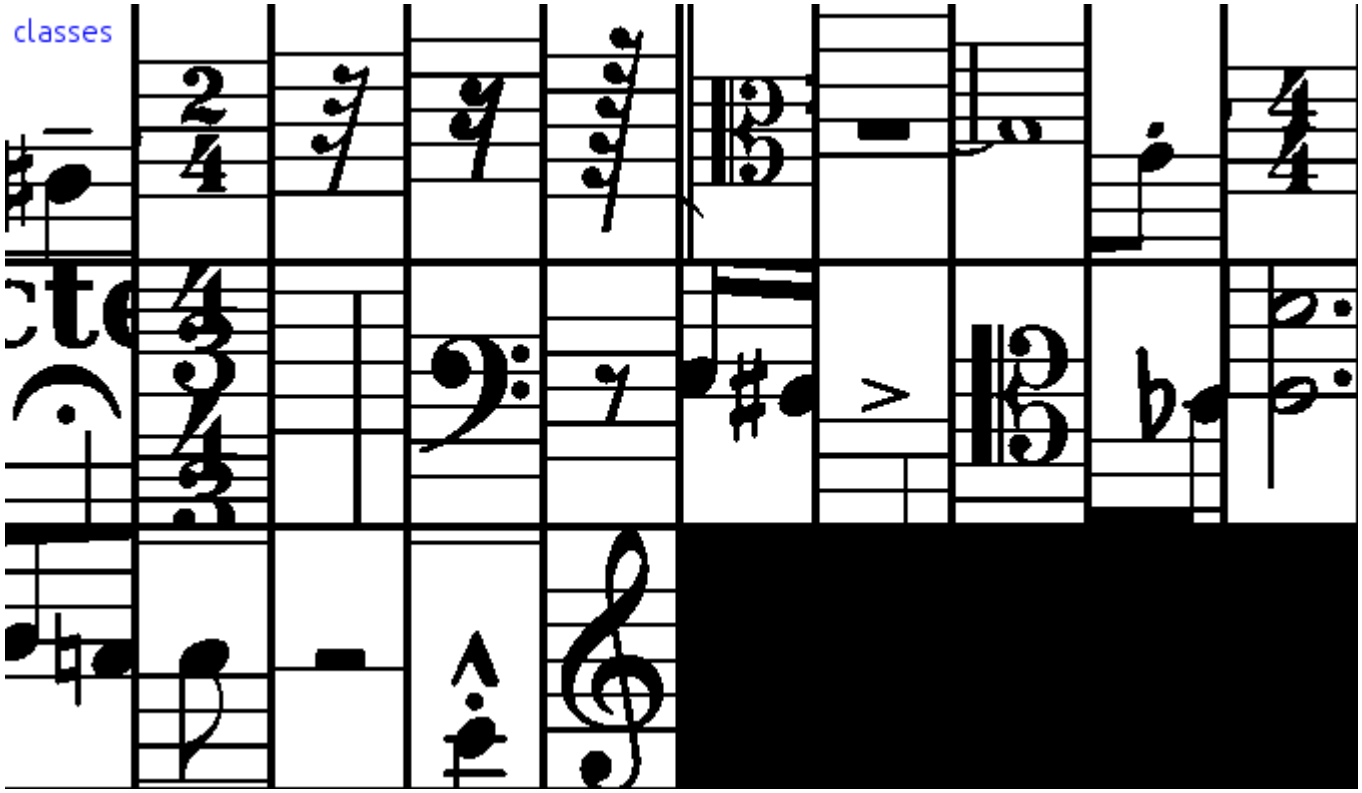


Solution to investigate?

- Train NN on context-full sub-images
  - ✓ Extract a sub-image centered on every symbol
  - ✓ Keep all pixels surrounding the symbol
  - ✓ No removal (not even staff lines)

- Expectations
  - ✓ Elegant solution to segmentation problems
  - ✓ Simplication of specific algorithms

Early ZHAW data



- Impressive recognition
  - ✓ Ratio ~99.5 %

Topic for « hack of the day »

- Use MuseScore symbolic data
  - ✓ To generate a bunch of sub-images
  - ✓ Even add some distortion?
  - ✓ The more data, the better recognition
- Scale sub-images properly
  - ✓ Using a fixed staff interline value (10 pixels?)
  - ✓ Would speed up training
  - ✓ Would provide bounding box for detected symbols
    - A way to detect overlaps
- Define and train a network on this data

Possible Audiveris integration

- Lookup valid candidate symbols
  - ✓ At every sheet location?
  - ✓ Use SIG to resolve conflicts
  - ✓ ...
- Apply first to current NN usage
  - ✓ SYMBOLS step
  - ✓ HEADERS step
- Then
  - ✓ HEADS step? (today based on template matching)

Thank you

Q & A

Audiveris [latin] := « *you will have heard* »
